

CannaSafe

Recently we started vetting and comparing licensed products we commonly test, with those found in the black markets. The results were shocking, to the extent that every single black market product tested would fail CA requirements for licensed product testing. On top of that, nearly all of these black market vapes contained significant amounts of Vitamin E Acetate, which has recently been discovered as the main culprit in causing consumers to become very ill, and resulting in 9 deaths. We will be issuing a comprehensive report with comparative data next week.

We have already tested Vitamin E for many of our Vape clients and encourage others to join.

So far we've tested for:

Dosist

Select

Heavy Hitters

Raw Garden

Kingpen

Pure Vape

Moxie

Sunderstorm

Alpine

Bloom Brand

Stiiizy

Lowell Herb Co

Orchid

Tikun

Island

California Dab Company

If you would like to participate and haven't, please email me. It is imperative that we stand united and use facts and science to justify the importance of the processes you all go through to deliver safe products to consumers.

A vaporizer ban would further perpetuate the problems that we are dealing with. The reality is these black market products are not safe, and are too readily available. Banning vapes would leave those illicit products as the only ones available. The opportunity is to educate the public, government, and media on the real risks of purchasing products from illicit markets. The regulations, testing, taxes are all put into place to benefit and protect consumers. We will share this data early next week that shows direct comparisons between licensed products and those that can be found on the black market.
